

Transfer Funds from Ethereum Mainnet to Polygon/Matic Mainnet

If you have tokens on the Ethereum network and you want to transfer them to Polygon / Matic you can use the Polygon / Matic Bridge. This bridge is a trustless two-way transaction channel and you can read more about it [here](#). The steps to transfer funds appear below. Note that it takes approximately 12-15 minutes in total for all three steps of the funds transfer.

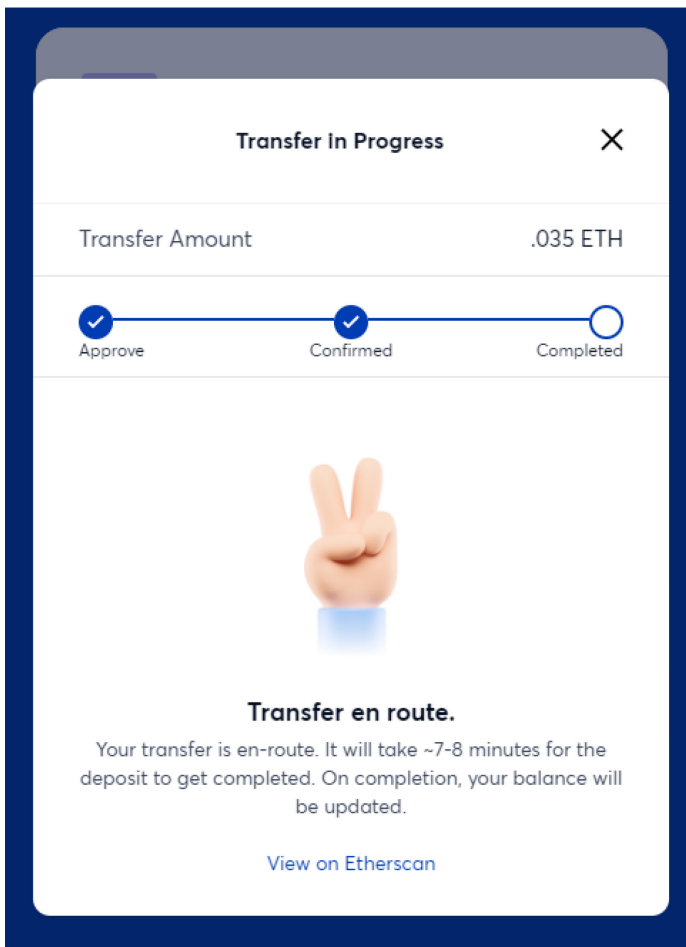

1. Navigate to the Polygon / Matic bridge website:
<https://wallet.matic.network/bridge/>
2. Connect your Metamask wallet and make sure you're in the account with your current balance(s) of UCT and UCTC. Make sure you have an amount of ETH also in the account for gas fees.
3. Select the token on the Ethereum chain that you want to move to the Polygon / Matic chain. You will need to do this one token at a time, eg. UCT Cash [UCTC] first, then Universal Community Trust [UCT] second.

4. After you approve the transfer, the process will begin to move funds. Note there will be two sets of gas fees payable in ETH for each transfer. The transfer process can take a while, so be patient.

5. After the transaction confirms on the Ethereum network the deposit will finalize on the Polygon / Matic network.

6. You will receive notification that the transaction is complete.

You will then see the balance of your UCT or UCTC tokens appearing in your Metamask wallet on the Polygon / Matic Mainnet network.
